Economie et emploi

L'hydrogène est marché qui croît rapidement et qui accompagne les pays engagés sur une décarbonation de leurs économies.

Il est important de considérer les emplois qui vont être créés ainsi que les besoins en programmes de formation requis pour que les entreprises puissent trouver des personnes compétentes. Les postes créés vont nécessiter des personnes hautement qualifiées et donc des salaires en conséquence.

It is important to look ahead to the jobs that will be created and the education, skills and training programmes that will need to be in place to enable employees to recruit the best candidates. Many of the roles will require a highly educated workforce that will, in turn will demand higher salaries. **This will have an impact upon a company's profits and overheads.**

However, the growth in the hydrogen market will see businesses expanding to serve a growing market and to meet the sustainable energy requirements. This will create more jobs and improve a company's revenue.

Economy and employment are closely linked with education and whilst the full requirements of some future job roles are not yet known, it is important for schools and technical colleges to keep up to date with the latest technologies. This will ensure that their students leave education with a clear understanding of the role that hydrogen can play in the future job market.

Just like the tariffs for the fossil fuels imported and exported now, it is likely that hydrogen will be subject to these. Again, the cost of these remain unknown but need to be considered when planning for a future economy based around hydrogen. Companies will need to balance the cost of investing in new technologies with the sanctions imposed upon them if they do not meet their decarbonising targets.
